

Retaining Wall with Varied Form and Function

Retaining wall created with Rockface showing to create a garden.

Curves and planting soften the look of the wall.

Practical retaining wall creating functional areas with no compromise on design.

Don't let the steep slope in your garden get in the way of your landscaping. TERRAFORCE RETAINING WALLS bring character and function to any landscape. If you are looking to enhance the feel of your garden and create space then a TERRAFORCE RETAINING WALL could be the answer.

In this particular project it was necessary to construct a level area for a new house. The whole site was excavated resulting in the need for a retaining wall system to prevent soil erosion. In order to keep the retaining wall within reasonable heights the wall was designed with several terraces. At all levels plants were established to create a LIVING WALL creating softness and texture between the blocks. Steps were also incorporated in this installation.

The completed wall shows a high quality ability to combine function with form and erosion control whilst maintaining good visual aesthetics that will continue to improve as plant growth continues.
